

Double string rollers

Two row string roller can be coupled with other implements like cultivator or harrow what composes tillage outfit. The advantage of coupling two tillage implements into one set is the possibility of having well prepared field to seeding or sowing after single run on the field. Thanks to the decrease of number of field run passes it is possible to avoid soil compaction by tractor wheels. The second advantage is a decrease of soil cultivation costs. The string roller causes insignificant soil compaction and applying the toothed bar ensures well crushed upper soil layer. The field pass of this kind of roller leaves thin, well crushed soil over the layer of slightly compacted soil. String rollers especially well prepare the field to the pointwise seeding (for ex. beets, maize, vegetables).

The offer contains two row string rollers with diameter **295 mm** fitted to cultivator working width from **1,8m to 3,6m**. The standard equipment contains screw type fastener that sets roller working depth. Holders for triangle plate and lights are fixed to the string roller frame.
